

1.A.5.b iii - Military Navigation

Short description

In sub-category 1.A.5.b *iii* - *Other, Mobile (including Military)* emissions from military navigation are reported.

Method	AD	EF	Key Category
T1, T2	NS, M	D, M, CS, T1, T3	see superordinate chapter

Method

Activity Data

Primary fuel data for national military waterborne activities is included in NEB lines 6 ('International Deep-Sea Bunkers') and 64 ('Coastal and Inland Navigation') for IMO and non-IMO ships respectively.

The annual shares used within NFR 1.A.5.b *iii* are therefore calculated within (Deichnik, K. (2019)), where ship movement data (AIS signal) allows for a bottom-up approach providing the needed differentiation.

Table 1: Annual fuel consumption, in terajoules

	= 1990	= 1995	= 2000	= 2005	= 2006	= 2007	= 2008	= 2009	= 2010	= 2011	= 2012	= 2013	= 2014	= 2015	= 2016	= 2017	= 2018
~ Diesel Oil	> 983	> 665	> 563	> 410	> 383	> 366	> 360	> 349	> 347	> 330	> 313	> 302	> 332	> 273	> 359	> 489	> 423

++ Emission factors

The emission factors applied here, are derived from different sources and therefore are of very different quality.

For the main pollutants, country-specific implied values are used, that are based on tier3 EF included in (Deichnik, K. (2019)) ²⁾ which mainly relate on values from the EMEP/EEA guidebook 2019 ³⁾. These modelled IEFs take into account the ship specific information derived from AIS data as well as the mix of fuel-qualities applied depending on the type of ship and the current state of activity.

Table 2: Annual country-specific emission factors for diesel fuels¹, in kg/TJ

	= 1990	= 1995	= 2000	= 2005	= 2006	= 2007	= 2008	= 2009	= 2010	= 2011	= 2012	= 2013	= 2014	= 2015	= 2016	= 2017	= 2018

NOTE: With respect to the emission factors applied for particulate matter, given the circumstances during test-bench measurements, condensables are most likely included at least partly.[footnote](#)
 During test-bench measurements, temperatures are likely to be significantly higher than under real-world conditions, thus reducing condensation. On the contrary, smaller dilution (higher number of primary particles acting as condensation germs) together with higher pressures increase the likeliness of condensation. So over-all condensables are very likely to occur but different to real-world conditions. [footnote](#)

For information on the **emission factors for heavy-metal and POP exhaust emissions**, please refer to [Appendix 2.3 - Heavy Metal \(HM\) exhaust emissions from mobile sources\]](#) and [Appendix 2.4 - Persistent Organic Pollutant \(POP\) exhaust emissions from mobile sources \]](#).

Discussion of emission trends

This sub-category is **not considered separately in the key category analysis**.

Due to the application of very several tier1 emission factors, most emission trends reported for this sub-category only reflect the trend in fuel deliveries. Therefore, the fuel-consumption dependent trends in emission estimates are only influenced by the annual fuel mix.

++ Selected main pollutants: NO,,x,,

[gallery size="medium" : 1A5biii_EM\(NOx\).png gallery](#)

++ Sulphur dioxide and particulate matter

As fuel sulphur content underlies strict legislation, the trends of these directly related emissions reflect the outcome of ever lower fuel sulphur contents.

-]

Recalculations

The small changes in the **activity data** applied result solely from a revised biofuel share for biodiesel in 2017:

Table 4: Revised fuel consumption data 2017, in terajoules

	= TOTAL	= Diesel Oil	= Biodiesel
~ Submission 2020	> 500.2	> 489.3	> 10.9
~ Submission 2019	> 500.6	> 489.3	> 11.3
~ absolute change	> -0.40	> 0.00	> -0.40
~ relative change	> -0.08%	> 0.00%	> -3.57%

In contrast, all (annual) country-specific **emission factors** remain unaltered.

For pollutant-specific information on recalculated emission estimates for Base Year and 2018, please see the pollutant specific recalculation tables following chapter [8.1 - Recalculations](#).

Uncertainties

See [superordinate chapter](#) on NFR 1.A.5.b.

Planned improvements

A **routine revision** of the underlying model is planned for the next annual submission.
