

# 1.A.3.a ii (i) - Domestic Civil Aviation: LTO

## Short description

In NFR category *1.A.3.a ii (i) - Domestic Civil Aviation: LTO* emissions from domestic flights between German airports occurring during LTO stage (Landing/Take-off: 0-3,000 feet) are reported.

| Category Code | Method          |                 |                 |       |     | AD    |     |     |     |      | EF       |     |     |                  |                   |

In the following, information on sub-category specific AD, (implied) emission factors and emission estimates are provided.

## Methodology

## Activity Data

Specific jet kerosene consumption during LTO-stage is calculated within TREMOD AV as described in the [superordinate chapter](#).

Table 1: Percentual annual fuel consumption during LTO-stage of domestic flights

|                          | 1990 | 1995 | 2000 | 2005 | 2006 | 2007 | 2008 | 2009 | 2010 | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 | 2019 |
|--------------------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| <b>Jet Kerosene</b>      | 30,2 | 29,4 | 27,9 | 27,6 | 27,5 | 27,3 | 27,3 | 27,3 | 27,6 | 27,7 | 28,0 | 27,9 | 27,7 | 27,7 | 28,1 | 28,3 | 28,4 | 28,1 |
| <b>Aviation Gasoline</b> | 18,9 | 36,0 | 33,6 | 50,2 | 52,1 | 55,4 | 51,6 | 51,2 | 49,9 | 46,7 | 49,1 | 54,0 | 56,8 | 51,4 | 61,8 | 62,0 | 68,0 | 76,0 |

source: Knörr et al. (2019c) <sup>1)</sup> & Gores (2019) <sup>2)</sup>

As explained above, the use of aviation gasoline is - due to a lack of further information - assumed to entirely take place within the LTO-range.

Table 2: annual LTO fuel consumption for domestic flights, in terajoule

|                          | 1990         | 1995         | 2000          | 2005         | 2006         | 2007         | 2008         | 2009         | 2010         | 2011         | 2012         | 2013         | 2014         | 2015         | 2016         | 2017         | 2018         | 2019         |

## Emission factors

All country-specific emission factors used for emission reporting were basically ascertained within UBA project FKZ 360 16 029 (Knörr, W., Schacht, A., & Gores, S. (2010)) <sup>5)</sup> and have since then been compiled, revised and maintained in TREMOD AV <sup>6)</sup>.

Furthermore, the **newly implemented EF(BC)** have been estimated via f-BCs as provided in the 2019 EMEP/EEA Guidebook <sup>7)</sup>, Chapter 1.A.3.a, 1.A.5.b Aviation, page 49: "Conclusion".

For more details, please see [superordinate chapter](#) on civil aviation.

NFR 1.A.3.a ii (i) - Domestic Civil Aviation - LTO is **no key source**.

Where **sulphur oxides** emissions are dominated by jet kerosene due to the amount of fuel used, the majority of **carbon monoxide** stems from the consumption of avgas given the much higher emission factor applied to this fuel.

[gallery size="medium" : 1A3aii\(i\)\\_SOx.png : 1A3aii\(i\)\\_CO.png](#) [gallery](#)

**Lead** emissions on the other hand, with no emission factor available for jet kerosene, are only calculated for avgas.

[gallery size="medium" : 1A3aii\(i\)\\_Pb.png](#) [gallery](#)

## Recalculations

### Activity data

In order to keep in line with the regularly updated data sets provided to the EEA by Eurocontrol, the average fuel use per LTO cycle has been updated again within TREMOD Aviation but with much smaller impact as in last year's submission.

Furthermore, as explained in the superordinate chapter, avgas consumption for international flights and outside the L/TO range has been estimated for the first time for this submission, with the respective amounts of avgas re-allocated accordingly.

Resulting from this revision, the percentual shares of kerosene consumed during LTO within TREMOD AV have been recalculated as shown in Table 4.

Table 4: Revised percentual share of kerosene consumed during L/TO for domestic flights, in %

|                        | 1990   | 1995   | 2000   | 2005   | 2006   | 2007   | 2008   | 2009   | 2010   | 2011   | 2012   | 2013   | 2014  | 2015   | 2016   | 2017   | 2018   |

Hence, the amount of kerosene allocated to sub-category 1.A.3.a ii (i) had to be revised accordingly:

In parallel, the majority of **country-specific emission factors** has been revised within TREMOD AV based on information available from the 2019 EMEP/EEA Guidebook <sup>9)</sup> and Eurocontrol's AEM model <sup>10)</sup>. Here, among others, the EF for SO<sub>2</sub>, from jet kerosene has been replaced by new and more reliable data showing no sulphur reduction since 1990.

Furthermore, all EF applied for aviation gasoline have been revised widely based on better knowledge

|----------------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|
| <b>relative<br/>change</b> |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|----------------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|

The TSP emissions calculated depend directly on the reported lead emissions: The emission factor for TSP is 1.6 times the emission factor used for lead:  $EF(TSP) = 1.6 \times EF(Pb)$ . The applied procedure is similar to the one used for calculating TSP emissions from leaded gasoline used in road transport.
