

1.A.3.a ii (i) - Domestic Civil Aviation: LTO

Short description

In NFR category *1.A.3.a ii (i) - Domestic Civil Aviation: LTO* emissions from domestic flights between German airports occurring during LTO stage (Landing/Take-off: 0-3,000 feet) are reported.

Category Code	Method					AD					EF				
1.A.3.a ii(i)	T1, T2, T3					NS, M					CS, D, M

In the following, information on sub-category specific AD, (implied) emission factors and emission estimates are provided.

Methodology

Activity Data

Specific jet kerosene consumption during LTO-stage is calculated within TREMOD AV as described in the [superordinate chapter](#).

Table 1: Percentual annual fuel consumption during LTO-stage of domestic flights

	1990	1995	2000	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019
Jet Kerosene	30,2	29,4	27,9	27,6	27,5	27,3	27,3	27,3	27,6	27,7	28,0	27,9	27,7	27,7	28,1	28,3	28,4	28,1
Aviation Gasoline	18,9	36,0	33,6	50,2	52,1	55,4	51,6	51,2	49,9	46,7	49,1	54,0	56,8	51,4	61,8	62,0	68,0	76,0

source: Knörr et al. (2019c) ¹⁾ & Gores (2019) ²⁾

As explained above, the use of aviation gasoline is - due to a lack of further information - assumed to entirely take place within the LTO-range.

Table 2: annual LTO fuel consumption for domestic flights, in terajoule

Emission factors

All country-specific emission factors used for emission reporting were basically ascertained within UBA project FKZ 360 16 029 (Knörr, W., Schacht, A., & Gores, S. (2010))⁵⁾ and have since then been compiled, revised and maintained in TREMOD AV⁶⁾.

Furthermore, the **newly implemented EF(BC)** have been estimated via f-BCs as provided in the 2019 EMEP/EEA Guidebook⁷⁾, Chapter 1.A.3.a, 1.A.5.b Aviation, page 49: "Conclusion".

For more details, please see [superordinate chapter](#) on civil aviation.

¹ calculated from the average lead content of AvGas 100 LL (low-lead) of 0.56 g Pb/liter

Trend discussion for Key Sources

NFR 1.A.3.a ii (i) - Domestic Civil Aviation - LTO is **no key source**.

Where **sulphur oxides** emissions are dominated by jet kerosene due to the amount of fuel used, the majority of **carbon monoxide** stems from the consumption of avgas given the much higher emission factor applied to this fuel.

[gallery size="medium" : 1A3aII\(i\)_SOx.png : 1A3aII\(i\)_CO.png gallery](#)

Lead emissions on the other hand, with no emission factor available for jet kerosene, are only calculated for avgas.

[gallery size="medium" : 1A3aII\(i\)_Pb.png gallery](#)

Recalculations

Activity data

In order to keep in line with the regularly updated data sets provided to the EEA by Eurocontrol, the average fuel use per LTO cycle has been updated again within TREMOD Aviation but with much smaller impact as in last year's submission.

Furthermore, as explained in the superordinate chapter, avgas consumption for international flights and outside the LTO range has been estimated for the first time for this submission, with the respective amounts of avgas re-allocated accordingly.

Resulting from this revision, the percentual shares of kerosene consumed during LTO within TREMOD AV have been recalculated as shown in Table 4.

Table 4: Revised percentual share of kerosene consumed during LTO for domestic flights, in %

	1990	1995	2000	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
Submission 2021	30,2	29,4	27,9	27,6	27,5	27,3	27,3	27,3	27,6	27,7	28,0	27,9	27,7	27,7	28,1	28,3	28,4
Submission 2020	30,5	29,5	28,1	27,7	27,7	27,4	27,4	27,4	27,7	27,8	28,1	28,0	27,6	27,8	28,2	28,4	28,5
absolute change	-0,29	-0,10	-0,13	-0,11	-0,11	-0,11	-0,10	-0,11	-0,11	-0,13	-0,13	-0,13	0,07	-0,12	-0,10	-0,10	-0,11
relative change	-0,94%	-0,33%	-0,45%	-0,39%	-0,40%	-0,42%	-0,37%	-0,40%	-0,41%	-0,45%	-0,45%	-0,48%	0,24%	-0,43%	-0,37%	-0,35%	-0,40%

Hence, the amount of kerosene allocated to sub-category 1.A.3.a ii (i) had to be revised accordingly:

In parallel, the majority of **country-specific emission factors** has been revised within TREMOD AV based on information available from the 2019 EMEP/EEA Guidebook ⁹⁾ and Eurocontrol's AEM model ¹⁰⁾. Here, among others, the EF for SO₂ from jet kerosene has been replaced by new and more reliable data showing no sulphur reduction since 1990.

Furthermore, all EF applied for aviation gasoline have been revised widely based on better knowledge but with no significant impact on the emission inventory.

The TSP emissions calculated depend directly on the reported lead emissions: The emission factor for TSP is 1.6 times the emission factor used for lead: $EF(TSP) = 1.6 \times EF(Pb)$. The applied procedure is similar to the one used for calculating TSP emissions from leaded gasoline used in road transport.
