

1.A.3.a i (i) - International Civil Aviation: LTO

Short description

In NFR category *1.A.3.a i (i) - International Civil Aviation: LTO* emissions during LTO stage (Landing/Take-off: 0-3,000 feet) are reported. In the following, information on sub-category specific AD, (implied) emission factors and emission estimates are provided.

Methodology

[illegible]

¹ estimated via a f-BCs (avgas: 0.15, jet kerosene: 0.48) as provided in ⁷⁾

² EF(PM_{2.5}) also applied for PM₁₀ and TSP (assumption: > 99% of TSP from diesel oil combustion consists of PM_{2.5})

³ also including TSP from lead: EF(TSP) = 1.6 x EF(Pb) - see road transport

For the country-specific emission factors applied for particulate matter, no clear indication is available, whether or not condensables are included.

Discussion of emission trends

NFR 1.A.3.a i (i) - International Civil Aviation - LTO is **no key category**.

Recalculations

As mentioned in the superordinate chapter on 1.A.3.a, the LTO fuel consumptions applied in TREMOD AV have been adapted to the the EMERP/EEA Guidebook 2019.⁸⁾

Hence, the percentual annual shares of kerosene consumed during L/TO for international flights have been re-estimated...

[illegible]

... and the amounts of kerosene allocated to sub-category 1.A.3.a i (i) were revised accordingly:

[illegible]

In parallel, the majority of **country-specific emission factors** has been revised within TREMOD AV based on information available from the 2019 EMEP/EEA Guidebook ⁹⁾ and Eurocontrol's AEM model ¹⁰⁾. Here, among others, the EF for SO₂ from jet kerosene has been replaced by new and more reliable data showing no sulphur reduction since 1990.
