In **NFR 2.B.6**, SO₂, emissions from the production of titanium dioxide are reported.

Method

For the **production of titanium dioxide**, the producers report the sum of all SO₂-emissions. As these emissions are confidential, they are included in the respective emissions reported for **sulphuric acid production**.

Recalculations

For SO₂, emissions from the production of **titanium dioxide** and **sulphuric acid**, estimates reported for the *second-last year* of the time series are routinely actualised by the producers. Furthermore, original emissions for the *last year of the time series* are not yet available at the time the inventory is compiled. Here, the reported values represent a prediction and are therefore updated with each new submission, too.

For Titandioxid production there is a small recalculation for the 2015 and 2016, because of technical problems with the data transfer.

Planned improvements

In the NEC Review Germany was requested to calculate emissions of NO_x, CO and TSP from titanium dioxide production. Germany tries to collect the data needed to calculate these emissions.
