

2.B.6 - Titanium Dioxide Production

Short description

| Method | AD | EF | Key Category |
|--------|----|----|--------------|
| T3 | ? | ? | ? |

In **NFR 2.B.6**, SO₂ emissions from the production of titanium dioxide are reported.

Methodology

For the **production of titanium dioxide**, the producers report the sum of all SO₂-emissions. As these emissions are confidential, they are included in the respective emissions reported for **sulphuric acid production**.

Recalculations

For SO₂ emissions from the production of **titanium dioxide** and **sulphuric acid**, estimates reported for the *second-last year* of the time series are routinely actualised by the producers. Furthermore, original emissions for the *last year of the time series* are not yet available at the time the inventory is compiled. Here, the reported values represent a prediction and are therefore updated with each new submission, too.

For Titandioxid production there is a small recalculation for the 2015 and 2016, because of technical problems with the data transfer.

For pollutant-specific information on recalculated emission estimates for Base Year and 2018, please see the pollutant specific recalculation tables following [chapter 8.1 - Recalculations](#).

Planned improvements

In the NEC Review Germany was requested to calculate emissions of NO_x, CO and TSP from titan dioxid production. Germany tries to collect the data needed to calculate these emissions.
