2.G.4(c) - Charcoal

In sub-category NFR 2.G.4(c) - Charcoal TSP, PM_{10} and $PM_{2.5}$ emissions from charcoal used for barbecue are reported.

Methodology

Activity data

The annual charcoal consumption for barbecue is calculated as annual import + production - export, and the relevant volumes of charcoal are extracted from national statistics by the Federal Statistical Office. Other applications for charcoal are not included.

The model is based on the two assumptions that there is no storage of charcoal and that all charcoal

is burned.

The amount of charcoal used for barbecue has been ever-expanding from 1990 to 2012 and is predominantly imported. As there is only one big producer, produced amounts and resulting emissions are confidential.

Emission factors

The emission factors are derived from the CEPMEIP Database (SNAP: 060508)¹⁾

Recalculations

The import and export data for 2018 were changed as revised activity data for the foreign sale was available from the Federal Statistical Office.

For specific information on recalculated emission estimates for Base Year and 2018, please see the pollutant specific recalculation tables following chapter 8.1 - Recalculations.

Planned improvements

No improvements are planned.
