

# 1.A.3.b iii - Transport: Road Transport: Heavy Duty Vehicles and Buses

## Short description

In sub-category 1.A.3.b iii - Road Transport: Heavy Duty Vehicles and Buses emissions from fuel combustion in trucks, lorries, buses etc. are reported.

## Methodology

### Activity data

Specific consumption data for heavy-duty vehicles (trucks and lorries) and buses are generated within TREMOD <sup>1)</sup>. - The following tables provide an overview of annual amounts of fuels consumed by these vehicles in Germany.

Table 1: Annual fuel consumption of trucks and lorries, in terajoules

|                        | 1990    | 1995    | 2000    | 2005    | 2006    | 2007    | 2008    | 2009    | 2010    | 2011    | 2012    | 2013    | 2014    | 2015    | 2016    | 2017    | 2018    | 2019    | 2020    |

source: TREMOD 6.02 <sup>2)</sup>

For information on mileage, please refer to sub-chapters on emissions from [tyre & brake wear and road abrasion](#).

## Emission factors

The majority of emission factors for exhaust emissions from road transport are taken from the 'Handbook Emission Factors for Road Transport' (HBEFA, version 4.1) <sup>3)</sup> where they are provided on a tier3 level mostly and processed within the TREMOD software used by the party <sup>4)</sup>.

However, it is not possible to present these tier3 values in a comprehensible way here.

With respect to the country-specific emission factors applied for particulate matter, given the circumstances during test-bench measurements, condensables are most likely included at least partly. <sup>1)</sup>

For heavy-metal (other than lead from leaded gasoline) and PAH exhaust-emissions, default emission factors from the 2019 EMEP Guidebook (EMEP/EEA, 2019) <sup>5)</sup> have been applied. Regarding PCDD/F, tier1 EF from (Rentz et al., 2008) <sup>6)</sup> are used instead.

Table 2: tier1 EF derived from default values

## Discussion of emission trends

### Outcome of Key Category Analysis

|      |                       |           |                        |                         |
|------|-----------------------|-----------|------------------------|-------------------------|
| for: | <b>NO<sub>x</sub></b> | <b>BC</b> | <b>PM<sub>10</sub></b> | <b>PM<sub>2.5</sub></b> |
| by:  | L/T                   | L/T       | L/T                    | L/T                     |

### Nitrogen oxides

Until 2005, NO<sub>x</sub> emissions followed mileage and fuel consumption. Since 2006, in contrast to nearly unchanged fuel consumption, emissions have decreased due to controlled catalytic-converter use and engine improvements resulting from continual tightening of emissions laws.

### Non-methane volatile organic compounds (NMVOC) and carbon monoxide

Since 1990, exhaust emissions of **NMVOC** and **carbon monoxide** have decreased sharply due to catalytic-converter use and engine improvements resulting from ongoing tightening of emissions laws and improved fuel quality.

### Ammonia and sulphur dioxide

As for the entire road transport sector, the trends for **sulphur dioxide** (SO<sub>2</sub>) and **ammonia** (NH<sub>3</sub>) exhaust emissions from heavy duty vehicles show characteristics different from those shown above: Here, the strong dependence on increasing fuel qualities (sulphur content) leads to a cascaded downward trend of SO<sub>2</sub> emissions, influenced only slightly by increases in fuel consumption and mileage. For **ammonia** emissions the increasing use of catalytic converters in gasoline driven cars in

the 1990s lead to a steep increase whereas both the technical development of the converters and the ongoing shift from gasoline to diesel cars resulted in decreasing emissions in the following years.

Particulate matter & Black carbon

As for all reported exhaust PM emissions from mobile diesel vehicles the Party assumes that nearly all particles emitted are within the PM<sub>2.5</sub> range, resulting in similar emission values for PM<sub>2.5</sub>, PM<sub>10</sub>, and TSP.

## Recalculations

Compared to submission 2020, recalculations were carried out due to a routine revision of the TREMOD software and the revision of several National Energy Balances (NEB).

Here, **activity data** were revised within TREMOD due to the provision of the final NEB 2018.

Furthermore, significant re-allocations of consumption shares between the different vehicle types and classes were conducted, effecting the entire time series but with the 1.A.3.b consumption totals remaining unaltered.

Table 4: Revised fuel consumption data, in terajoules

Due to the variety of highly specific tier3 **emission factors** applied, it is not possible to display any changes in these data sets in a comprehensible way.

For more information on recalculated emission estimates reported for Base Year and 2019, please see the pollutant-specific recalculation tables following chapter [8.1 - Recalculations](#).

## Planned improvements

Besides a routine revision of the underlying model, no specific improvements are planned.

## FAQs

<sup>1)</sup> During test-bench measurements, temperatures are likely to be significantly higher than under real-world conditions, thus reducing condensation. On the contrary, smaller dilution (higher number of primary particles acting as condensation germs) together with higher pressures increase the likeliness of condensation. So over-all condensables are very likely to occur but different to real-world conditions.
