Methodology

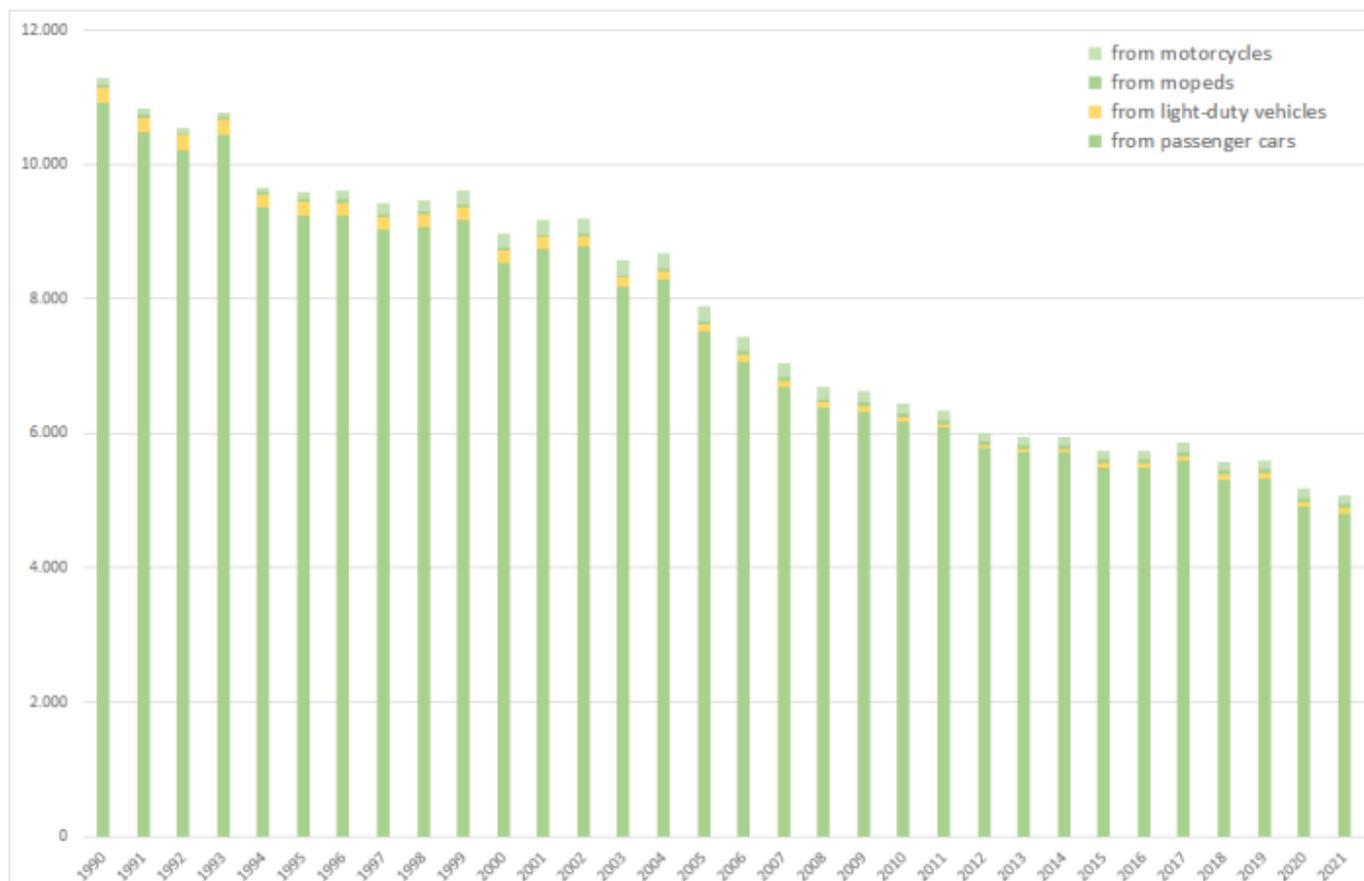

Activity data

Specific data for gasoline evaporation from road vehicles are generated within TREMOD ¹⁾. - The following table provides an overview of annual amounts of gasoline evaporated from road vehicles in Germany.

Discussion of emission trends

Table 3: Outcome of Key Category Analysis

for:	NMVOG
by:	Level & Trend

NFR 1.A.3.b v is key source for emissions of Non-Methane Volatile Organic Compounds - NMVOG. (*fugitive emissions only; no NMVOG emissions from fuel combustion included*)

Since its maximum level of over 11,000 kilotonnes in 1990, the amount of evaporated gasoline is decreasing - and so are the related NMVOC emissions. The amounts of evaporated gasoline are connected directly with those of gasoline consumed. Here, the decrease becomes sharper from 2000 onwards following a growing switch from gasoline to diesel oil especially in passenger cars. Here, the annual amounts of NMVOC emissions from evaporation not only depend directly on the amount of evaporated gasoline but also on the number of vehicles equipped with mitigation technologies. Thus, the decrease is sharpest straight after 1990 and since then slowing down.

Recalculations

Activity data have been revised for all years.

In addition, the NMVOC **emission factors** applied were revised for several years.

As a result, NMVOC emissions from gasoline evaporation were re-estimated as follows:

Planned improvements

Besides a routine revision of the underlying model, no specific improvements are planned.
