2.A.5.a - Quarrying & Mining - Other Than Coal

Short description

Category Code	Method		AD	EF	
2.A.5.a	T1		NS	D	

Key Category	SO₂	NOₓ	NH₃	NMVOC	CO	BC	Pb	Hg	Cd	Diox	PAH	HCB	TSP	PM₁₀	PM₂ ₅
2.A.5.a	-	-	-	-	-	-	-	-	-	-	-	-	L/-	L/T	L/-

T = key source by Trend **L** = key source by Level

Methods	
D	Default
T1	Tier 1 / Simple Methodology *
T2	Tier 2*
T3	Tier 3 / Detailed Methodology *
C	CORINAIR
CS	Country Specific
M	Model

* as described in the EMEP/EEA Emission Inventory Guidebook - 2019, in the group specific chapters.

AD - Data Source for Activity Data	
NS	National Statistics
RS	Regional Statistics
IS	International Statistics
PS	Plant Specific data
As	Associations, business organisations
Q	specific Questionnaires (or surveys)
M	Model / Modelled
C	Confidential

EF - Emission Factors	
D	Default (EMEP Guidebook)
C	Confidential
CS	Country Specific
PS	Plant Specific data
M	Model / Modelled

The mining process emits relevant amounts of particles. Quarrying and mining of minerals other than coal is subsumed, in particular mining of limestone, hard rock and building sands. Information about the current relevance is shown in 2.A - Mineral Industry.

Methodology

With the use of the 2019 GB method [1], a Tier 2 method is available that can reflect different national conditions.

Since the GB tool in principle calculates emissions for exactly one year [2], files must be available for exactly those years in which input data are available. Intermediate years are interpolated in case of data gaps.

With the help of the GB tools, IEFs are reported on an annual basis, which are used for the inventory method AR x EF. Thus the activity data are presented transparently and can be discussed with data suppliers. The emission factors can be modified if further information on the parameters of the GB-tool is available.

Trend discussion

Trends in emissions follow the shrinking mining activities.

trends of emissions of Quarrying & Mining

Emissions by pollutant / Emissionen nach Schadstoff
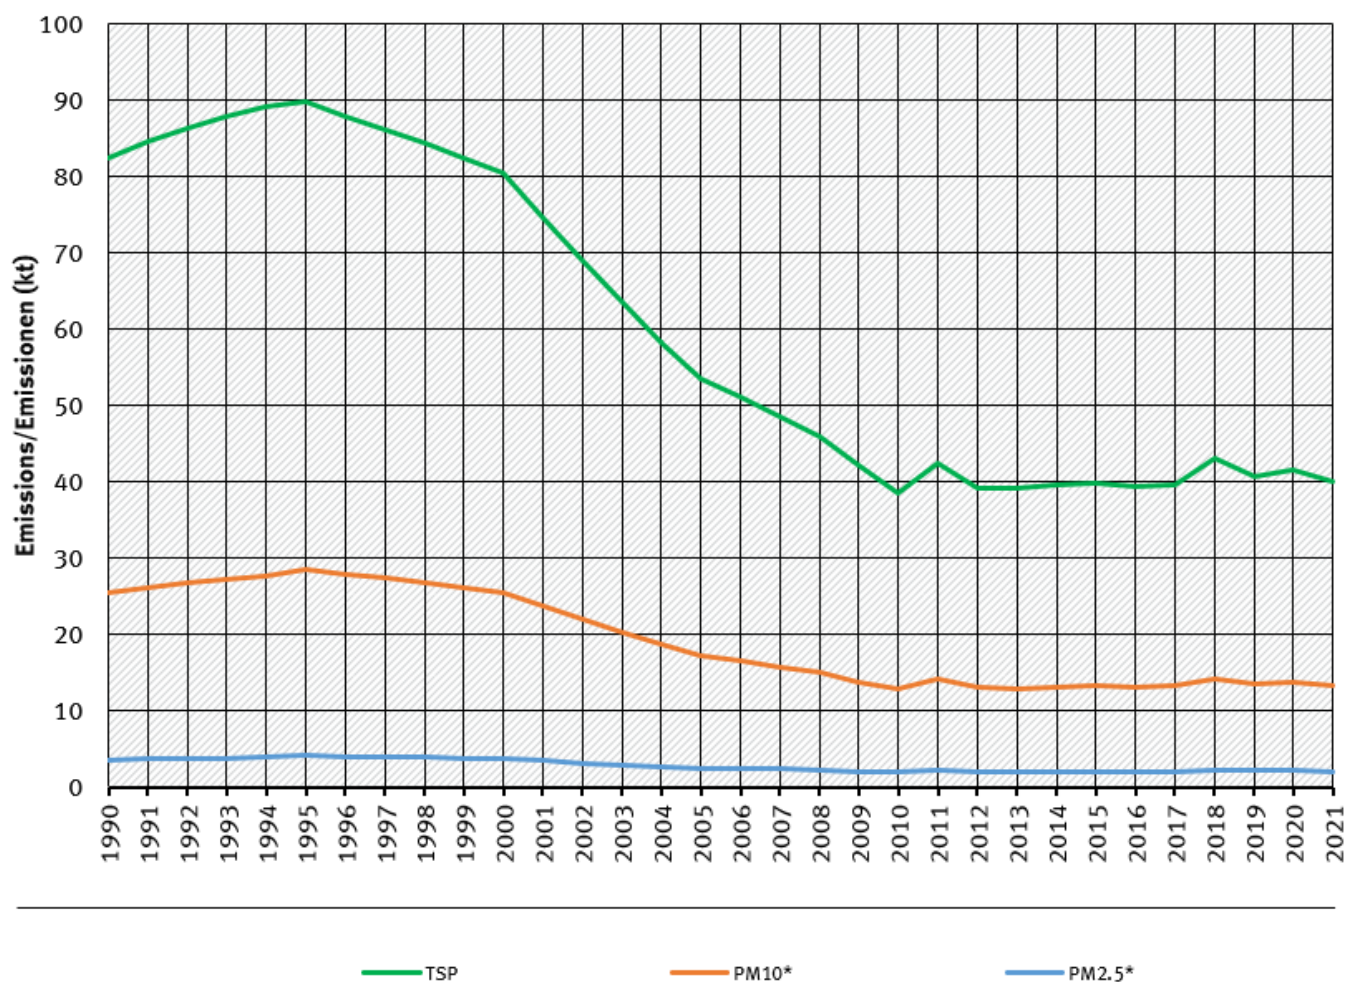

* Base Year for PM = 1995 / Basisjahr für Feinstäube (PM) ist 1995

Emission trends in NFR 2.A.5.a

Recalculations

Recalculations were necessary due to minor revised AD for the last recent year.

Planned improvements

At the moment, no category-specific improvements are planned.

Short description - Salt Production

Salt production is a sub-category of the mining activities in respect of the country specific approach used. Currently, a Tier 1 method is used: information on production of salts are multiplied with emission factors for TSP and PM.

Method

Activity data

The data from national statistics includes production of potash and rock salt. Potash salt is dominating, nevertheless gaps of statistics are filled and emissions are modelled as potash salt only.

Emission factors

The emission factors are based on analogy to bulk product handling by an expert judgements from UBA:

Table 2: Overview of applied emission factors, in kg/t salt

Pollutant	EF value	EF trend
TSP	0.031	constant
PM_{10}	0.016	constant
$PM_{2.5}$	0.003	constant

Planned improvements

At the moment, no category-specific improvements are planned.
