| UPTC              | Unquantified potential technical correction  |

## I. Introduction

1. The review of the air pollutant emission data submitted by Member States under the European Union's National Emissions reduction Commitments Directive (Directive (EU) 2016/2284<sup>1</sup>) is established in Article 10(3):

*"The Commission, assisted by the European Environment Agency and in consultation with the Member States concerned, shall review the national emission inventory data in the first year of reporting and regularly thereafter. That review shall involve the following:*

*(a) checks to verify the transparency, accuracy, consistency, comparability and completeness of information submitted;*

*(b) checks to identify cases where inventory data is prepared in a manner which is inconsistent with the requirements set out under international law, in particular under the LRTAP Convention;*

*(c) where appropriate, calculation of the resulting technical corrections necessary, in consultation with the Member State concerned.*

*Where the Member State concerned and the Commission are unable to reach an agreement on the necessity or on the content of the technical corrections pursuant to point (c), the Commission shall adopt a decision laying down the technical corrections to be applied by the Member State concerned."*

2. The technical review of the National Emission reduction Commitments Directive (NECD) inventories in 2022 (hereafter referred to as the '2022 NECD inventory review') was undertaken in accordance with the NECD air emission inventory review guidelines established at the beginning of the project.

## II. Objectives of the review

3. The general objective of the technical review of Member States' NECD inventories as reported in February 2022 (and resubmitted before 29 April 2022) is to provide recommendations to drive improvements of transparency, consistency, comparability, completeness and accuracy of information submitted. As such the review will contribute to establishing accurate, reliable and verified emission inventories for all Member States, which will also be used for compliance checks.

4. The specific objectives of the 2022 NECD inventory review were:

- A detailed review to verify that Member States have integrated all of the open recommendations, unquantified potential technical corrections, technical

---

<sup>1</sup> DIRECTIVE (EU) 2016/2284 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 14 December 2016 on the reduction of national emissions of certain atmospheric pollutants, amending Directive 2003/35/EC and repealing Directive 2001/81/EC

corrections and revised estimates for the pollutants<sup>2</sup> NO<sub>x</sub>, NMVOC, SO<sub>2</sub>, NH<sub>3</sub>, PM<sub>2.5</sub> and PM<sub>10</sub> identified in the previous NECD inventory reviews<sup>3</sup>.

- A review of the recalculations between the 2021 and 2022 national inventory submissions for the pollutants NO<sub>x</sub>, NMVOC, SO<sub>2</sub>, NH<sub>3</sub>, PM<sub>2.5</sub> and PM<sub>10</sub> for the years 2005, 2018 and 2019.
- A review of the time series consistency with a special focus on the years 2005, 2019 and 2020 for the pollutants: NO<sub>x</sub>, NMVOC, SO<sub>2</sub>, NH<sub>3</sub>, PM<sub>2.5</sub> and PM<sub>10</sub><sup>4</sup>.
- In accordance with the requirements of the NECD (Article 5 and Annex IV) and in line with the “Technical guidance for Parties making adjustment applications and for the expert review of adjustment applications (ECE/EB.Air/130)”<sup>5</sup> and the technical guidance on “Inventory adjustments in the context of emission reduction commitments”<sup>6</sup>, an expert review of:
  - i. All flexibility applications as detailed in Article 5 of the NECD, including an assessment whether the conditions listed in Article 5 were fulfilled.
  - ii. In particular, for adjustment applications, the review of the supporting documentation as requested in part 4 of Annex IV to the NECD and an assessment of whether the adjustment application is consistent with the circumstances described therein.
- A comparison of the reviewed national totals for compliance, for each pollutant, with the maximum allowed emission levels calculated on the basis of the national emission reduction commitments set out in the NECD.

---

<sup>2</sup> In cases where recommendations from the 2021 review cover pollutants to be reviewed as part of the 2022 NECD inventory review (main pollutants and PM<sub>10</sub>) **and** any other pollutants previously reviewed under the NECD inventory review (BC, CO, BaP, PAHs, PCBs, HCB, Cd, Hg, Pb, PCDD/F), recommendations were screened by the initial checks team to determine their relevance for the 2022 NECD inventory review. Those found to be of significance to the emission estimates of main pollutants or PM<sub>10</sub> were passed to the review team for full assessment, i.e. covering both main pollutants and PM<sub>10</sub> as well as any of the other pollutants, in the follow-up to the 2021 NECD inventory review that was conducted as part of the 2022 NECD inventory review.

<sup>3</sup> NECD inventory review 2021 reports are available at [https://environment.ec.europa.eu/topics/air/reducing-emissions-air-pollutants/emissions-inventories\\_en#review-of-national-emission-inventories](https://environment.ec.europa.eu/topics/air/reducing-emissions-air-pollutants/emissions-inventories_en#review-of-national-emission-inventories)

<sup>4</sup> The year 2005 was compared to the years 2006 to 2010 and the year 2020 was compared to 2015 to 2019.

### III. Review approach, team and scope

5. The scope of the 2022 NECD inventory review is summarised in Table 1.

**Table 1: Scope of the 2022 NECD inventory review (under Directive (EU) 2016/2284)**

| Element               | Scope   | Further information  |
|-----------------------|---|--|
| Geographical coverage | EU geographical coverage of the Member States as of 1 January 2022  | Includes the geographical territory of the Member States, their exclusive economic zones and pollution control zones. Excludes the Canary Islands, the French overseas departments, Madeira, and the Azores  |
| Years                 | 2005, 2018-2020   | In addition, time series consistency between the years 2019 and 2020 was reviewed  |
| Pollutants            | Main pollutants NO <sub>x</sub> , NMVOC, SO <sub>2</sub> , NH <sub>3</sub> , PM <sub>2.5</sub> , and PM <sub>10</sub> | See also NECD (Directive (EU) 2016/2284) Annex I   |
| Categories            | All NFR categories, including selected memo items   | All NFR categories that contribute to the national total, and the national total itself, shall be considered. The following memo items shall also be included:<br>1A3ai(ii) International aviation cruise (civil)<br>1A3aii(ii) Domestic aviation cruise (civil)<br>1A3di(i) International maritime navigation<br>1A3 Transport (fuel used) – where it is used for compliance purposes |
| National totals       | National total and national total for compliance  | Rows 141 and 154 in Annex 1 of reporting guidelines  |

6. The review was split into two phases:

- a) **Initial checks** were carried out by the project team. Significant findings from the initial checks that were not resolved within the initial checks phase were followed up by the technical expert review team during the desk review and centralised review.
- b) **A desk review and centralised review** were performed by the technical expert review team. The technical expert review team consisted of the following experts:
  - **Lead Reviewers:** Kevin Hausmann, Ole-Kenneth Nielsen, Anne Misra
  - **Energy:** Marlene Schmidt Plejdrup, Stephan Poupa, Dirk Wever
  - **Transport:** Jean-Marc André, Giannis Papadimitriou, Katrina Young
  - **IPPU – excl. solvents:** Kristina Saarinen, Ils Moorkens, Robert Stewart
  - **IPPU – incl. solvents:** Traute Köther, Emma Salisbury, Rianne Dröge
  - **Agriculture:** Jeremy Wiltshire, Etienne Mathias, Mette Hjorth Mikkelsen
  - **Waste:** Céline Gueguen, Elisabeth Kampel, Romain Bort

This year, the desk review started with a review of flexibility applications under Article 5 of the NECD. This was followed by an in-depth desk review of the NECD submissions for SO<sub>2</sub>, NO<sub>x</sub>, PM<sub>2.5</sub>, NH<sub>3</sub>, NMVOC and PM<sub>10</sub>, which lasted for four weeks. Member States then had two weeks to reply to questions from the desk reviewers. After this, the centralised review took place for one week, during which the technical expert review team could send follow-up questions to Member States.

7. The desk review and centralised review were coordinated by the project team (led by Sabine Schindlbacher and Chris Dore).
8. The EEA Review Secretariat led by Levente Molnar supported the 2022 NECD inventory review.
9. The review was performed on the basis of NECD emission data officially reported by Germany by 15 February 2022 for emission inventories. The Informative Inventory Reports (IIR) reported by 15 March 2022 under the NECD informed the review. Resubmissions and other additional information officially submitted by Member States were taken into account until 29 April 2022.
10. To avoid any potential conflicts of interest, the lead reviewers and sector experts did not review emission inventories of Member States where these individuals had themselves contributed to the compilation of that inventory, or presently are or have been any part of the decision-making process related to the compilation of that inventory. Reviewers who are nationals of the Member State whose inventory is concerned, did not act as main sector expert for this Member State.
11. All sector experts signed confidentiality agreements in which they agreed to keep information received by Member States confidential.
12. Definitions for findings included in the Final Review Report can be found in Table 2.

**Table 2: Definitions for finding classifications of the 2022 NECD inventory review.**

|                |   |
|----------------|---|
| Recommendation | A finding where an identified issue has not been resolved during the course of the review but which is not above the threshold of significance.   |
| RE             | Revised estimate: a new estimate a Member State has provided in response to an issue raised (finding) by the technical expert review team (TERT) during the course of the review.   |
| TC             | Technical correction: Issued by the technical expert review team for findings identified which result in an over- or under-estimate of more than a 0.5% of the national total in one of the reported years under review and where Member States did not provide a revised estimate which was accepted by the technical expert review team (TERT) <sup>7</sup> . |

<sup>7</sup> In previous reviews, unquantified potential technical corrections were assigned to issues when it was not possible for the technical expert review team to calculate a technical correction during the timeframe of the review or with reasonable effort. In the 2022 review, the TERT did not assign any issues as unquantified technical corrections. The TERT sought to quantify all potential technical corrections thus ensuring that all major issues that could have an impact on compliance are quantified. If uncertainty was too high and a quantification was not possible the issue was labelled as recommendation.

#### IV. Overall assessment of the quality of the submissions

13. The technical expert review team considers the inventory submission to be of very good quality in terms of completeness and accuracy. The IIR generally describes the methods transparently, but improvements could be made especially related to IPPU (non-solvents) and the waste sector

14. To improve the quality of these submissions, the technical expert review team suggests that Germany:

- Improve completeness by calculating missing emissions for sources even if the emissions are expected to be small, e.g. recommendation DE-3B4h-2022-0001;
- Further improve the transparency of the IIR by providing detailed information on assumptions and methodologies e.g. recommendation DE-2-2022-0002, DE-2H1-2022-0002, DE-5-2022-0001.

15. The technical expert review team considers that it received responses from Germany that were sufficient in order to undertake the NECD inventory review 2022.

## V. Findings and Conclusions from the technical expert review team for the in-depth review of national emission inventories for NO<sub>x</sub>, NMVOC, SO<sub>2</sub>, NH<sub>3</sub>, PM<sub>2.5</sub> and PM<sub>10</sub>

16. The technical expert review team assessed the implementation of all findings related to main pollutants and PM<sub>10</sub> from the 2021 NECD inventory review<sup>8</sup>.
17. The technical expert review team carried out in-depth checks to verify the transparency, accuracy, consistency, comparability and completeness of the main pollutants and PM<sub>10</sub> inventory. The focus was on the years 2005 and 2018 to 2020.
18. The assessment was based on the emission inventory submitted in 2022 by Germany pursuant to Directive (EU) 2016/2284 and on the German review report from the 2021 NECD inventory review.
19. Resubmissions and other additional information provided by Member States during the review were taken into account until 29 April 2022.
20. Table 3 gives an overview of the number of recommendations, revised estimates and technical corrections for NO<sub>x</sub>, NMVOC, SO<sub>2</sub>, NH<sub>3</sub>, PM<sub>2.5</sub> and PM<sub>10</sub> that are described in detail in Table 44. The table also shows the number of recommendations, revised estimates and technical corrections that were included in the 2022 NECD inventory review reports for other Member States in the form of a range from lowest to highest number.
21. Table 44 provides all the findings from the technical expert review team related to NO<sub>x</sub>, NMVOC, SO<sub>2</sub>, NH<sub>3</sub>, PM<sub>2.5</sub> and PM<sub>10</sub> including those made during the 2022 NECD inventory review and those not implemented from the 2021 NECD inventory review. The implementation of the recommendations will be followed up in the 2023 NECD inventory review.

**Table 3: Overview of the number of findings included in the 2022 NECD inventory review report related to NO<sub>x</sub>, NMVOC, SO<sub>2</sub>, NH<sub>3</sub>, PM<sub>2.5</sub> and PM<sub>10</sub><sup>9</sup>**

|  | TC*      | RE*      | Recommendation |
|--|----------|----------|----------------|
| <b>Number of findings included in the 2022 Review Report (see Table 4 below)</b> | <b>0</b> | <b>1</b> | <b>13</b>      |
| (Range for All Member States)  | (0-7)    | (0-4)    | (2-47)         |

\* TC = technical correction, RE = revised estimate

<sup>8</sup> In cases where recommendations from the 2021 review covered pollutants to be reviewed as part of the 2022 NECD inventory review (main pollutants and PM<sub>10</sub>) and any other pollutant previously reviewed under the NECD inventory review (BC, CO, BaP, PAHs, PCBs, HCB, Cd, Hg, Pb, PCDD/F), recommendations were screened by the initial checks team to determine their relevance for the 2022 NECD inventory review. Those found to be of significance to the emission estimates of main pollutants or PM<sub>10</sub> were passed to the review team for assessment in the follow-up to the 2021 NECD inventory review conducted as part of the 2022 NECD inventory review.

<sup>9</sup> The numbers here represent the sum of findings originally issued in previous years and not yet implemented and of new findings first issued as part of the 2022 NECD inventory review.

**Table 4: All findings for NO<sub>x</sub>, NMVOC, SO<sub>2</sub>, NH<sub>3</sub>, PM<sub>2.5</sub> and PM<sub>10</sub>, including those made during the 2022 NECD inventory review and those not implemented from previous reviews**

| Review year of initial recommendation (number of years it has been recommended)  | Observation          | Key Category | NFR, Pollutant(s), Year(s)   | RE, TC or UPTC in 2021 | RE or TC in 2022 | Tier 1 used for Key Category |
|--|----------------------|--------------|--|------------------------|------------------|------------------------------|
| 2022 (1)   | DE-3Dc-2022-0001     | Yes          | 3Dc Farm-Level Agricultural Operations Including Storage, Handling and Transport of Agricultural Products, PM <sub>10</sub> , 1990-2020                                    | NA                     | RE               | Yes                          |
| <p><b>Recommendation</b><br/>                     For 3Dc Farm-Level Agricultural Operations Including Storage, Handling and Transport of Agricultural Products and particulate matter for all years, the TERT noted that Germany estimated emissions using a Tier 1 while the category is key. In response to a question raised during the review, Germany explained that all data were not available, but national data were combined with data from a neighbouring country (Denmark). Germany provided a revised estimate for all years. The TERT agreed with the revised estimate provided by Germany.<br/> <b>The TERT recommends that Germany include the revised estimate in its 2023 NFR and IIR submission.</b></p>   |                      |              |  |                        |                  |                              |
| Review year of initial recommendation (number of years it has been recommended)  | Observation          | Key Category | NFR, Pollutant(s), Year(s)   | RE, TC or UPTC in 2021 | RE or TC in 2022 | Tier 1 used for Key Category |
| 2018 (5)   | DE-1A4ciii-2018-0001 | No           | 1A4ciii Agriculture/Forestry/Fishing: National Fishing, SO <sub>2</sub> , NO <sub>x</sub> , NH <sub>3</sub> , NMVOC, PM <sub>2.5</sub> , PAHs, PCBs, Cd, Hg, Pb, 2014-2020 | No                     | No               | No                           |
| <p><b>Assessment of the implementation of the initial recommendation</b><br/>                     For category 1A4ciii Agriculture/Forestry/Fishing: National Fishing and Activity data, the TERT noted that there is a lack of transparency regarding the high increase from 2014 onwards. This does not relate to an over- or under-estimate of emissions. This was raised during the 2018, 2019, 2020 and 2021 NECD inventory reviews. In response to a question raised during the review, Germany explained that allocation of maritime fuel consumption to sub sectors is done via a model using AIS data. This model could misallocate fuel consumption between maritime sub-sectors, but as fishing fuel consumption is very low and even emission factors could be different, it could not be above the threshold.<br/> <b>The TERT recommends that Germany check the model based on AIS data and recalculate, if necessary, the time series by reallocating fuel consumption via the model and provide the relevant documentation in its 2023 IIR submission.</b></p> |                      |              |  |                        |                  |                              |
| Review year of initial recommendation (number of years it has been recommended)  | Observation          | Key Category | NFR, Pollutant(s), Year(s)   | RE, TC or UPTC in 2021 | RE or TC in 2022 | Tier 1 used for Key Category |
| 2022 (1)   | DE-1A5b-2022-0001    | No           | 1A5b Other, Mobile (Including Military, Land Based and Recreational Boats), NO <sub>x</sub> , 2005   | NA                     | No               | No                           |

**Recommendation**

For category 1A5b Other, Mobile (Including Military, Land Based and Recreational Boats) and NO<sub>x</sub> for 2005, the TERT noted that there is a lack of transparency regarding the emissions outlier in 2005 compared to 2000-2010 emissions. This does not relate to an over- or under-estimate of emissions. In response to a question raised during the review, Germany explained that the strong increase in NO<sub>x</sub> emissions from 1A5b in 2005 is dominated by an even stronger increase in diesel oil input together with the high NO<sub>x</sub> emission factors for diesel combustion in military ground vehicles and vessels.

**The TERT recommends that Germany include the explanation provided during the review in the 2023 IIR submission.**

| Review year of initial recommendation (number of years it has been recommended) | Observation       | Key Category | NFR, Pollutant(s), Year(s)   | RE, TC or UPTC in 2021 | RE or TC in 2022 | Tier 1 used for Key Category |
|---|-------------------|--------------|--|------------------------|------------------|------------------------------|
| 2022 (1)  | DE-1A5b-2022-0002 | No           | 1A5b Other, Mobile (Including Military, Land Based and Recreational Boats), PM <sub>2.5</sub> , 2005 | NA                     | No               | No                           |

**Recommendation**

For category 1A5b Other, Mobile (Including Military, Land Based and Recreational Boats) and PM<sub>2.5</sub> for 2005, the TERT noted that there is a lack of transparency regarding the emissions outlier in 2005 compared to 2000-2010 emissions. This does not relate to an over- or under-estimate of emissions. In response to a question raised during the review, Germany explained that the strong increase in PM<sub>2.5</sub> emissions from 1A5b in 2005 is dominated by an even stronger increase in diesel oil input together with the high PM<sub>2.5</sub> emission factors for diesel combustion in military ground vehicles and vessels.

**The TERT recommends that Germany include the explanation provided during the review in the 2023 IIR submission.**

| Review year of initial recommendation (number of years it has been recommended) | Observation    | Key Category | NFR, Pollutant(s), Year(s) | RE, TC or UPTC in 2021 | RE or TC in 2022 | Tier 1 used for Key Category |
|---|----------------|--------------|----------------------------|------------------------|------------------|------------------------------|
| 2022 (1)  | DE-2-2022-0002 | No           | 2 Industry, NA, 1990-2020  | NA                     | No               | No                           |

**Recommendation**

For 2C4 Magnesium Production and all pollutants for all years, the TERT noted that there is a lack of transparency regarding the use of notation keys. Germany reports emissions from this category as 'NE' or 'NA' but for no pollutant the notation key 'IE' is used, while in the IIR it is stated: There is no primary magnesium production in Germany (not occurring - 'NO'). - Any emissions from the production of secondary magnesium are reported in sub-category 1A2b.' In response to a question raised during the review, Germany responded that the notation keys for 2C4 in the NFR tables were not consistent with the description in the IIR. Furthermore, in Germany secondary production of magnesium occurs in some rather small foundries and that in addition to emissions arising from combustion activities in the production process, dust and metals could also be emitted as process emissions. Germany also noted that for these pollutants no emission factors are not available either in the inventory Guidebook 2019 or from other sources and hence, the right notation key for them is 'NE'. Germany indicated that the notation keys will be changed and the IIR text updated in the next submission.

**The TERT recommends Germany to change the notation keys and to include the related explanation in the IIR.**

| Review year of initial recommendation (number of years it has been recommended) | Observation | Key Category | NFR, Pollutant(s), Year(s) | RE, TC or UPTC in 2021 | RE or TC in 2022 | Tier 1 used for Key Category |
|---|-------------|--------------|----------------------------|------------------------|------------------|------------------------------|
|---|-------------|--------------|----------------------------|------------------------|------------------|------------------------------|

|  |                   |              |   |                        |                  |                              |
|--|-------------------|--------------|---|------------------------|------------------|------------------------------|
| 2022 (1)   | DE-2D3c-2022-0001 | Yes          | 2D3c Asphalt Roofing, PM <sub>2.5</sub> , PM <sub>10</sub> , 1990-2020              | NA                     | No               | No                           |
| <p><b>Recommendation</b><br/> For 2D3c Asphalt Roofing and particulate matter for all years, the TERT noted that Germany did not provide estimates and was using the notation key 'NA' (not applicable) in its NFR. In response to a question raised during the review, Germany explained that the estimation is based on the manufactured area (m<sup>2</sup>) and an emission factor for PM (g/Mg single). A conversion factor is not provided by the EMEP/EEA Guidebook and is country specific. Furthermore, Germany stated that in the country a wide product range is used. Germany provided data for 1990-2020 to demonstrate that the issue is below the threshold of significance and stated that it will further improve the emissions estimates by including emissions estimates derived from industrial observations.</p> <p><b>The TERT recommends that Germany include emission estimates for 2D3c for particulate matter in the 2023 NFR, or otherwise reports on the progress made implementing this improvement in the 2023 IIR submission.</b></p> |                   |              |   |                        |                  |                              |
| Review year of initial recommendation (number of years it has been recommended)  | Observation       | Key Category | NFR, Pollutant(s), Year(s)  | RE, TC or UPTC in 2021 | RE or TC in 2022 | Tier 1 used for Key Category |
| 2022 (1)   | DE-2G-2022-0001   | Yes          | 2G Other Product Use, SO <sub>2</sub> , PM <sub>2.5</sub> , PM <sub>10</sub> , 2020 | NA                     | No               | No                           |
| <p><b>Recommendation</b><br/> The TERT noted with reference to NFR 2G Other Product Use, SO<sub>x</sub> and particles and the related IIR chapter that there is a lack of transparency regarding the drop in the emissions in 2020 from the previous rather steady trend. This does not relate to an over- or under-estimate of emissions. In response to a question raised during the review, Germany explained that there were simple reasons behind the enormous drop of emission levels in 2020 as due to corona virus the official sale of fireworks for New Year's Eve 2020/2021 was forbidden in December 2020 by the federal government and many events and festivities were also not allowed for several months. This resulted in the overall consumption of fireworks declining more than 80 % compared to former years. The situation will persist in 2021. Germany stated that they would include a brief explanation in the IIR.</p> <p><b>The TERT recommends Germany to include the information provided in the next IIR submission</b></p>           |                   |              |   |                        |                  |                              |
| Review year of initial recommendation (number of years it has been recommended)  | Observation       | Key Category | NFR, Pollutant(s), Year(s)  | RE, TC or UPTC in 2021 | RE or TC in 2022 | Tier 1 used for Key Category |
| 2022 (1)   | DE-2H1-2022-0002  | No           | 2H1 Pulp and Paper Industry, SO <sub>2</sub> , NA, 1990-2020                        | NA                     | No               | No                           |

**Recommendation**

The TERT noted with reference to NFR 2H1 Pulp and Paper Industry, all pollutants and the related IIR chapter that there may be an under-estimate of emissions. This under-estimate may have an impact on total emissions that is above the threshold of significance. The TERT noted that this under-estimate may be because Germany reports 'IE' for all pollutants under NFR 1A2d and it could be assumed that the fuel-related emissions are thus allocated under 2H1 (while there is no indication in the IIR), however, for BC and CO the notation key 'NE' is used. The TERT also questioned whether the German SO<sub>2</sub> EF includes TRS (total reduced sulphur) compounds and whether checks on data reported by the plants for incidental emissions during exceptional situations, when NH<sub>3</sub> fumes and additional TRS emissions may occur, especially NH<sub>3</sub> from a possible acid-based sulphite process. In response to a question raised during the review, Germany responded that, within the IIR, the different allocations are explained under [https://iir.umweltbundesamt.de/2022/sector/energy/fuel\\_combustion/industry/pulp\\_paper\\_and\\_print](https://iir.umweltbundesamt.de/2022/sector/energy/fuel_combustion/industry/pulp_paper_and_print), and further that it is indicated in the IIR that emissions from fossil fired power plants and boiler systems are reported in 'NFR 1A2g viii: Other' and not in '2H1'. They went on to say that under [https://iir.umweltbundesamt.de/2022/sector/ippu/pulp\\_paper\\_food/pulp\\_and\\_paper\\_industry/start](https://iir.umweltbundesamt.de/2022/sector/ippu/pulp_paper_food/pulp_and_paper_industry/start) the SO<sub>2</sub> emissions are explained, and we report these emissions within the NFR, too. Furthermore, Germany clarified that because of the odours of reduced sulphur, the two relevant plants are practically leak-proof - otherwise they would not be permitted in Germany. All residues end up in (liquor)-recovery boilers and do not emit in reduced form. Exceptions with ammonia emissions are prohibited and actually excluded. Both circumstances are therefore not relevant for Germany, but this can be explained in more detail in the IIR. During the commenting phase of this draft inventory review report Germany additionally explained that it is not possible to report combustion related emissions under the dedicated category 1.A.2.d for purposes of comparison as the emission estimates are based on a complete report of branches with EF for all occurring emissions in sum.

**The TERT recommends that for transparency in their inventory Germany (1) improve the current documentation under 2H1 of the allocation of all emissions from the pulp and paper industry, (2) include an explanation of the management of process related sulphur and ammonia emissions for pulping processes occurring in Germany.**

| Review year of initial recommendation (number of years it has been recommended) | Observation     | Key Category | NFR, Pollutant(s), Year(s)  | RE, TC or UPTC in 2021 | RE or TC in 2022 | Tier 1 used for Key Category |
|---|-----------------|--------------|---|------------------------|------------------|------------------------------|
| 2022 (1)  | DE-2J-2022-0001 | No           | 2J Production of POPs, SO <sub>2</sub> , NO <sub>x</sub> , NH <sub>3</sub> , NMVOC, PM <sub>2.5</sub> , BaP, PAHs, PCBs, HCB, Cd, Hg, Pb, PCDD/F, PM <sub>10</sub> , CO, BC, TSP, 1990-2020 | NA                     | No               | No                           |

**Recommendation**

For 2J Production of POPs and all pollutants for all years, the TERT noted that there is a lack of transparency regarding the use of notation keys because the notation keys 'NA' and 'NE' do not match the explanation in the IIR where it is stated 'Neither the twelve initial POPs under the Stockholm Convention (Aldrin, Dieldrin, Chlordane, Toxaphene, Mirex, Endrin, Heptachlor, Hexachlorobenzene (HCB), Polychlorinated biphenyls (PCB), DDT, Polychlorinated dibenzo-p-dioxins (PCDD), Polychlorinated dibenzofurans (PCDF)) nor PAHs are produced in Germany.'. This does not relate to an over- or under-estimate of emissions. In response to a question raised during the review, Germany confirmed that they will change the notation key to 'NO' (not occurring).

**The TERT recommends that Germany change the notation keys and include the related explanations in the IIR in the next submission.**

| Review year of initial recommendation (number of years it has been recommended) | Observation     | Key Category | NFR, Pollutant(s), Year(s)  | RE, TC or UPTC in 2021 | RE or TC in 2022 | Tier 1 used for Key Category |
|---|-----------------|--------------|---|------------------------|------------------|------------------------------|
| 2022 (1)  | DE-2K-2022-0001 | No           | 2K Consumption of POPs and Heavy Metals, SO <sub>2</sub> , NO <sub>x</sub> , NH <sub>3</sub> , NMVOC, PM <sub>2.5</sub> , BaP, PAHs, PCBs, HCB, Cd, Hg, Pb, PCDD/F, PM <sub>10</sub> , CO, BC, TSP, 1990-2020 | NA                     | No               | No                           |

**Recommendation**

The TERT noted with reference to NFR 2K Consumption of POPs and Heavy Metals (e.g. electrical and scientific equipment), all pollutants that Germany reported either as 'NA' or 'NE' and in the IIR Chapter 2K, that there is lack of transparency on the use of these notation keys and the explanation provided in the IIR, where it is stated 'None of the twelve initial POPs under the Stockholm Convention (Aldrin, Dieldrin, Chlordane, Toxaphene, Mirex, Endrin, Heptachlor, Hexachlorobenzene (HCB), Polychlorinated biphenyls (PCB), DDT, Polychlorinated dibenzo-p-dioxins (PCDD), Polychlorinated dibenzofurans (PCDF)) is consumed / on sale in Germany.' During the commenting phase of this inventory review report Germany confirmed that the current use of notation keys is appropriate.

**The TERT recommends that Germany update the IIR to provide a full and transparent justification for the use of these NKs in the 2023 IIR submission.**

| Review year of initial recommendation (number of years it has been recommended) | Observation       | Key Category | NFR, Pollutant(s), Year(s)   | RE, TC or UPTC in 2021 | RE or TC in 2022 | Tier 1 used for Key Category |
|---|-------------------|--------------|--|------------------------|------------------|------------------------------|
| 2022 (1)  | DE-3B4h-2022-0001 | Yes          | 3B4h Manure Management - Other Animals, NMVOC, NH <sub>3</sub> , 1990-2020 | NA                     | No               | No                           |

**Recommendation**

For category 3B4h Manure Management - Other Animals, NMVOC and NH<sub>3</sub> for all years, the TERT noted that the notation key 'NE' (not estimated) is used. However, in the IIR note to Table 1 (Chapter 3B) it is mentioned that the numbers of other animals were estimated in a single year, with reference to Rösemann et. al. (2017) (Chapter 9). In the CRF it is mentioned that the category of other animals includes rabbits, ostriches and fur-bearing animals, but no estimates for the populations are provided. In response to a question raised during the review, Germany explained that the number of animals in category 3B4h is limited and has low impact on the total NH<sub>3</sub> and NO<sub>x</sub> emissions, but Germany agreed to obtain further activity data for the entire time series and report the emissions in a future submission. The TERT noted that the issue is below the threshold of significance for a technical correction.

**The TERT recommends Germany to collect the necessary data and to estimate and report the emissions from 3B4h Manure Management - Other Animals (rabbits, ostriches and fur-bearing animals) in the next submission.**

| Review year of initial recommendation (number of years it has been recommended) | Observation     | Key Category | NFR, Pollutant(s), Year(s)  | RE, TC or UPTC in 2021 | RE or TC in 2022 | Tier 1 used for Key Category |
|---|-----------------|--------------|---|------------------------|------------------|------------------------------|
| 2022 (1)  | DE-3D-2022-0001 | Yes          | 3D Crop Production and Agricultural Soils, NO <sub>x</sub> , NH <sub>3</sub> , NMVOC, PM <sub>2.5</sub> , PM <sub>10</sub> , TSP, 1990-2020 | NA                     | No               | No                           |

**Recommendation**

For 3D Crop Production and Agricultural Soils, the TERT noted that there is a lack of transparency regarding activity data reported in the NFR tables for years 1990-2020. The TERT acknowledges that activity data are mentioned in the IIR, but do not always include all years (for example 2006-2009). By including the activity data in the NFR, the transparency for emissions calculations would be improved, because all activity data for every single year would be available, and data could be read directly from the NFR during the review process. This does not relate to an over- or under-estimate of emissions. In response to a question raised during the review, Germany confirmed that activity data for all years will be entered into the NFR tables in the next submission.

**The TERT welcomes this and recommends that Germany report activity data for all relevant subsectors under 3D in the next submission.**

| Review year of initial recommendation (number of years it has been recommended) | Observation | Key Category | NFR, Pollutant(s), Year(s) | RE, TC or UPTC in 2021 | RE or TC in 2022 | Tier 1 used for Key Category |
|---|-------------|--------------|----------------------------|------------------------|------------------|------------------------------|
|---|-------------|--------------|----------------------------|------------------------|------------------|------------------------------|

|  |                    |              |  |                        |                  |                              |
|--|--------------------|--------------|--|------------------------|------------------|------------------------------|
| 2022 (1)   | DE-3Da2a-2022-0001 | No           | 3Da2a Animal Manure Applied to Soils, NMVOC, 1990-2020         | NA                     | No               | No                           |
| <p><b>Recommendation</b><br/> For category 3Da2a Animal Manure Applied to Soils and NMVOC for all years, the TERT noted the notation key 'NA' (not applicable) is used, whilst emission estimates are expected, because emissions from dairy cattle and non-dairy cattle are based on a Tier 2 approach. In response to a question raised during the review Germany explained that the NMVOC emissions are included in 3B and that the correct notation key would be 'IE'. The TERT noted that the issue is related to allocation of emissions.<br/> <b>The TERT recommends that Germany split NMVOC emissions from livestock production into the correct NFR categories; 3B, 3Da2a and 3Da3 in the next submission, or if this is not possible to correct the notation key.</b></p>   |                    |              |  |                        |                  |                              |
| Review year of initial recommendation (number of years it has been recommended)  | Observation        | Key Category | NFR, Pollutant(s), Year(s)                                     | RE, TC or UPTC in 2021 | RE or TC in 2022 | Tier 1 used for Key Category |
| 2022 (1)   | DE-5-2022-0001     | No           | 5D1 Domestic Wastewater Treatment, NH <sub>3</sub> , 1990-2020 | NA                     | No               | No                           |
| <p><b>Recommendation</b><br/> For 5D1 Domestic Wastewater Treatment and NH<sub>3</sub> for all years, the TERT noted that there is a lack of transparency regarding dry toilets (including latrines). There is no information in the IIR to explain why NH<sub>3</sub> emissions are not estimated, and the notation key used by Germany in the NFR table is 'NA'. In response to a question raised during the review, Germany explained that according to national experts, dry toilets (including latrines) do not play a role in sewage treatment in Germany because they are not in compliance with the legislation and thus do not constitute a procedure of orderly wastewater disposal. This does not relate to an over- or under-estimate of emissions.<br/> <b>The TERT recommends that Germany provide this information in the IIR in the next submission and clarify when legislation came into force that meant that dry toilets were non-compliant.</b></p> |                    |              |  |                        |                  |                              |

## VI. Effect of revised estimates and technical corrections on the national total and national total for compliance

22. The tables below show the direct changes to the national totals and national totals for compliance resulting from the 2022 NECD inventory review. These changes include all revised estimates and technical corrections. The tables also show the impact that these changes have on the reported national total (row 141, Annex I) and national total for compliance (row 154, Annex I).

23. For the year 2020, the national emission reduction commitments 2020 to 2029, as set out in Directive (EU) 2016/2284, have been applied to express the maximum allowed emission for 2020 in absolute numbers in order to allow for a comparison with the national total for compliance. 2005 emissions ( $E_{2005}$ ) reported in the 2022 inventory submission after taking into account any technical corrections and revised estimates were used for the calculation. The emission reduction commitment for 2020 to 2029 from the NECD was applied to  $E_{2005}$ , which gives the maximum allowed emission for 2020 ( $MaxE_{2020}$ ). If the national total reported for 2020 and after taking into account any technical corrections and revised estimates is smaller than  $MaxE_{2020}$ , compliance is achieved.

**Table 5: National totals for compliance as reported and, where relevant, national totals for compliance including revised estimates (RE) and technical corrections (TC) for NO<sub>x</sub>, NMVOC, SO<sub>2</sub>, NH<sub>3</sub>, PM<sub>2.5</sub>, PM<sub>10</sub> and maximum national allowed emissions calculated on the basis of the national emission reduction commitments<sup>10</sup>**

<sup>10</sup> The tables presented in this report show numbers rounded to three decimal places for presentation purposes. However, for all calculations, all available decimal places were used. Therefore, a calculation undertaken with the data with three decimal places shown in this table may lead to slightly different results than from the calculations undertaken with the precise data used for the assessment.

<sup>11</sup> The National Total for compliance is based on fuel sold data. For NMVOC and NO<sub>x</sub>, emissions from agriculture (3B and 3D) were subtracted.

## VII. Compliance with 2020 Emission Reduction Commitments (ERCs)

24. The national emission reduction commitments listed in Annex II of the NEC Directive 2016/2284 are applicable from 2020 to 2029. Therefore, the 2022 NECD inventory review included a compliance check of 2020 air pollutant emission data against emission reduction commitments for 2020 to 2029 for the pollutants NO<sub>x</sub>, NMVOC, SO<sub>2</sub>, NH<sub>3</sub> and PM<sub>2.5</sub>.

25. Table 6 provides an overview of Germany's compliance with the 2020 emission reduction commitments for the pollutants NO<sub>x</sub>, NMVOC, SO<sub>2</sub>, NH<sub>3</sub> and PM<sub>2.5</sub>. 2005 emissions (E<sub>2005</sub>)<sup>12</sup> were used to perform the calculations underlying the compliance check. The % emission reduction commitments from the NEC Directive was applied to E<sub>2005</sub>, which gives the maximum allowed emission in 2020 (MaxE<sub>2020</sub>). If the national total for compliance for 2020 including technical corrections (accepted by Member State) and revised estimates (accepted by the TERT) (see also Table 5) is smaller than MaxE<sub>2020</sub>, compliance is achieved.

*Table 6 Overview of compliance with 2020 emission reduction commitments<sup>13</sup>*

| Pollutants        | National total for compliance (kt) 2005 | National total for compliance (kt) 2020 | Emission reduction commitment 2020 (%) | Maximum allowed emissions (kt) 2020 <sup>a</sup> | Compliant |
|-------------------|---|---|--|--|-----------|
| NO <sub>x</sub>   | 1,514.513                               | 870.648                                 | -39                                    | 923.853  | Yes       |
| NMVOC             | 1,179.698                               | 736.828                                 | -13                                    | 1,026.337  | Yes       |
| SO <sub>2</sub>   | 472.755                                 | 232.686                                 | -21                                    | 373.477  | Yes       |
| NH <sub>3</sub>   | 603.132                                 | 537.268                                 | -5                                     | 572.975  | Yes       |
| PM <sub>2.5</sub> | 135.984                                 | 82.162                                  | -26                                    | 100.628  | Yes       |

<sup>a</sup> MaxE<sub>2020</sub> = E<sub>2005</sub> - % emission reduction commitments 2020 x E<sub>2005</sub>

26. Germany is in compliance with its national emission reduction commitment for 2020 for NO<sub>x</sub> (**Error! Reference source not found.**).

27. Germany is in compliance with its national emission reduction commitment for 2020 for NMVOC (**Error! Reference source not found.**).

28. Germany is in compliance with its national emission reduction commitment for 2020 for SO<sub>2</sub> (**Error! Reference source not found.**).

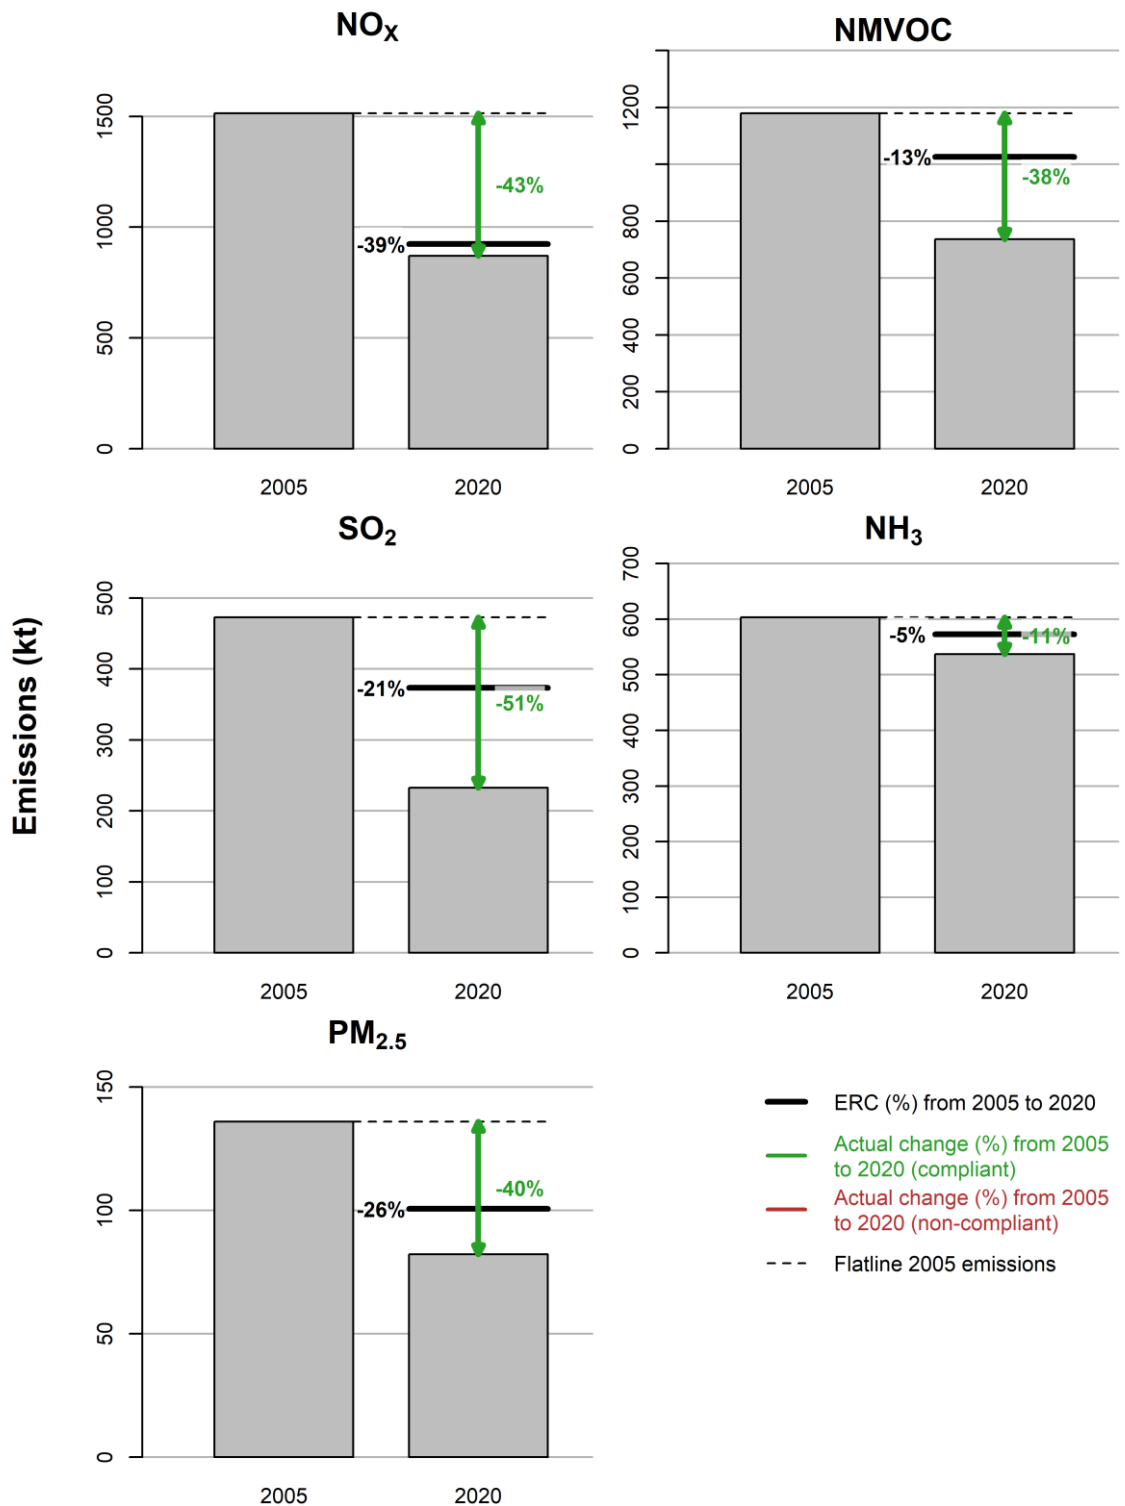

29. Germany is in compliance with its national emission reduction commitment for 2020 for NH<sub>3</sub> (**Error! Reference source not found.**).

<sup>12</sup> National total for compliance estimates including revised estimates accepted by the TERT and technical corrections accepted by Member State (see also Table 5) were used as E<sub>2005</sub>.

<sup>13</sup> The tables presented in this report show numbers rounded to three decimal places for presentation purposes. However, for all calculations, all available decimal places were used. Therefore, calculations undertaken with the data with three decimal places shown in this table may lead to slightly different results than calculations undertaken with the precise data used for the assessment.

30. Germany is in compliance with its national emission reduction commitment for 2020 for PM<sub>2.5</sub> (**Error! Reference source not found.**).

Figure 1 Visual illustration of compliance with 2020 emission reduction commitments for  $\text{NO}_x$ , NMVOC,  $\text{SO}_2$ ,  $\text{NH}_3$  and  $\text{PM}_{2.5}$ <sup>14</sup>

<sup>14</sup> The compliance checks are based on absolute numbers using all decimal places provided by the Member State. Figure 1 serves only as visual illustration.

## VIII. Statement from Germany on the conclusions presented by the technical expert review team

31. Germany agrees with the calculated estimates in **Error! Reference source not found.****Error! Reference source not found..**

## IX. Technical expert review team response to the statement from Germany

32. The TERT would like to thank Germany for comments provided on the draft version of this NECD inventory review report. The TERT revised recommendations in light of the comments received. For observation DE-2D3c-2022-0001, the recommendation was revised to acknowledge that Germany would be unable to implement the recommended improvement by the 2023 submission. Therefore, the TERT has recommended that Germany report progress on implementation in the 2023 submission of the IIR. For observation DE-2H1-2022-0002 the recommendation has been revised to focus on transparency in light of the comment from Germany that splitting emissions between combustion and process emissions is not readily feasible. For observation DE-2K-2022-0001 the recommendation was revised in acknowledgement of Germany's confirmation that the current use of notation keys is appropriate. The recommendation therefore now is to provide a full and transparent justification for the use of the notation keys in the 2023 submission of the IIR.

## ANNEX I Technical corrections deemed necessary by the technical expert review team and revised estimates provided by Germany

33. Germany did not have any Technical Corrections and had 1 Revised Estimate(s) in the NECD Inventory Review 2022.

34. The technical expert review team calculated technical corrections for cases:

- where it did not agree with the way in which a revised estimate or technical correction from the 2021 NECD inventory review was implemented and where no revised estimate was accepted by the technical expert review team during the review
- and where the suggested finding of the technical expert review team would change the National Total by more than 0.5% and where no revised estimate was accepted by the technical expert review team during the review.

35. The methods for calculating the technical corrections are set up in the “Guidance on technical corrections” and use the EMEP/EEA inventory guidebook as a reference for methods and emission factors.
